Level 2 Chemistry, 2017

91165 Demonstrate understanding of the properties of selected organic compounds

2.00 p.m. Thursday 16 November 2017
Credits: Four

Achievement	Achievement with Merit	Achievement with Excellence
Demonstrate understanding of the properties of selected organic compounds.	Demonstrate in-depth understanding of the properties of selected organic compounds.	Demonstrate comprehensive understanding of the properties of selected organic compounds.

Check that the National Student Number (NSN) on your admission slip is the same as the number at the top of this page.

You should attempt ALL the questions in this booklet.

A periodic table is provided on the Resource Sheet L2–CHEMR.

If you need more room for any answer, use the extra space provided at the back of this booklet and clearly number the question.

Check that this booklet has pages 2–12 in the correct order and that none of these pages is blank.

YOU MUST HAND THIS BOOKLET TO THE SUPERVISOR AT THE END OF THE EXAMINATION.

Achievement

TOTAL 11

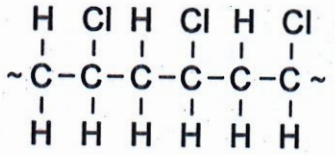
ASSESSOR'S USE ONLY

QUESTION ONE

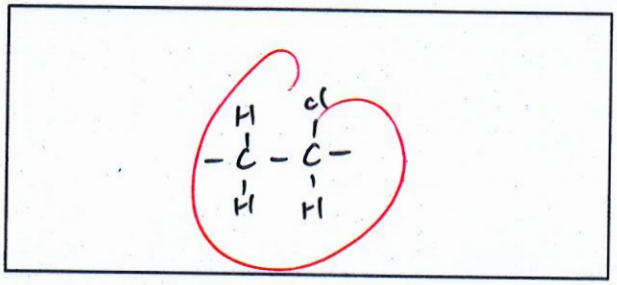
ASSESSOR'S USE ONLY

(a) Polyvinyl chloride (polychloroethene) is often used to make artificial leather. This can then be used to cover chairs, cover car seats, and make clothing.

A section of a polyvinyl chloride molecule is shown below.



(i) Draw the monomer from which the polymer polyvinyl chloride would be made.



(ii) Explain the difference in the structures and chemical reactivity of the monomer and polymer, and why the difference is important for the uses of the polymer.

There are many ~~same~~ same chains in the polyvinyl chloride molecule. They made up of  monomer.

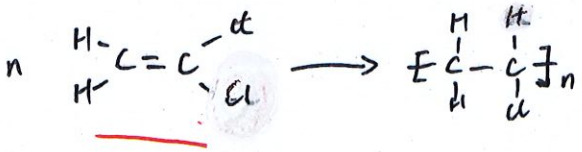
(iii) Making polyvinyl chloride (polychloroethene) from its monomer is called 'addition polymerisation'.

Explain the term 'addition polymerisation' using polyvinyl chloride as an example.

Include an equation in your answer.

ASSESSOR'S USE ONLY

Equation:

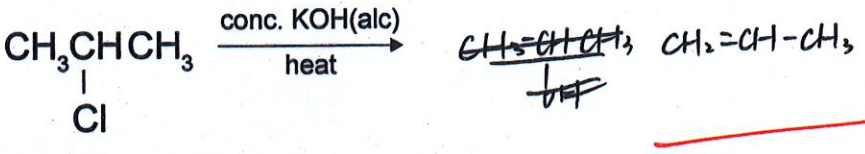


4

ASSESSOR'S USE ONLY

(b) A chemistry class was learning about the chemistry of haloalkanes. They were researching the effect of heat and concentrated potassium hydroxide in ethanol, conc. KOH(alc), on the haloalkane 2-chloropropane.

(i) Draw the organic product formed in the following reaction.



~~$CH_3{=}CHCH_3$~~ $CH_2{=}CH{-}CH_3$

4

(ii) Explain how the functional group of the organic product drawn above could be identified.

~~The -OH group connect with Carbon which is connect -Cl group before. This is substitution reaction.~~

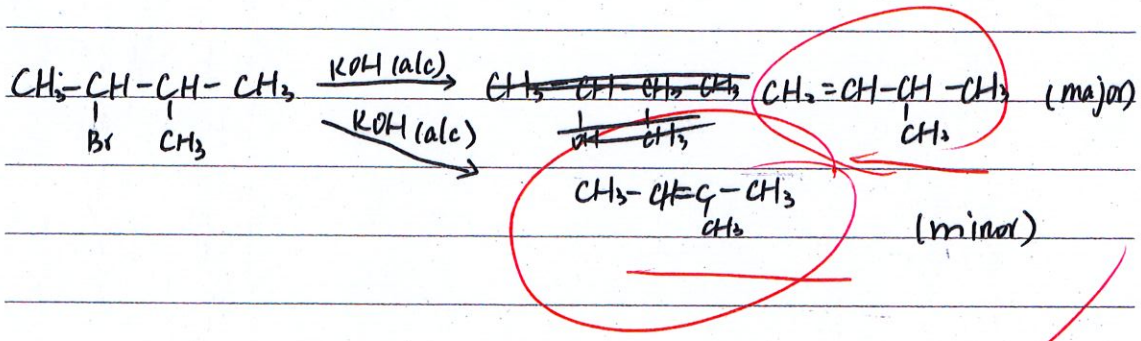
The C=C double bond group product and -Cl group removed.

(iii) 2-bromo-3-methylbutane also reacts with conc. KOH(alc). However, in this reaction TWO organic products are formed, a major and a minor product.

Give an account of the chemical processes that occur in this reaction.

In your answer you should:

- write an equation for this reaction showing the organic compounds
- name the type of reaction occurring
- explain how the products form
- explain which product you would expect to be the minor product.



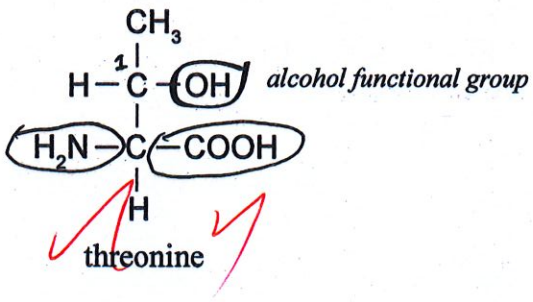
ASSESSOR'S USE ONLY

A3

QUESTION TWO

ASSESSOR'S USE ONLY

(a) The structure of a molecule of an organic compound, threonine, is shown below.



An alcohol functional group has been identified in the threonine molecule above.

(i) Circle and name **two other** functional groups on the threonine molecule above.

(ii) Classify the alcohol functional group as primary, secondary, or tertiary.

Secondary.

(iii) Explain how you classified the alcohol group.

Becaus the C atom which ~~co~~conect with -OH group also conect with the other 2 c atoms. So it's secondary.

(b) Name the organic compounds in the table below.

Compound	IUPAC (systematic) name
$CH_3-CH_2-CH_2-C\equiv CH$	~~1-penta~~ ~~1-pentyne~~ 1-pentyne
$CH_3-\overset{2}{C}H(Br)-\overset{3}{C}H(CH_3)-CH_2-CH_2-CH_3$	2-bromo-3-methylhexane
$CH_3-CH_2-CH(OH)-C(CH_3)_2-CH_3$	~~4,4-dimethylpentol~~ 4,4,-dimethyl-3-pentol

(c) (i) Draw four alkene isomers for the organic compound C_4H_8 in the table below.

ASSESSOR'S USE ONLY

1. 	**2.** 3. 	**4.** 
(ii) Identify the compounds that are *cis* and *trans* (geometric) isomers from the table above.

	cis	**trans**
Number		
Justify your choices, and explain why only these two compounds are *cis* and *trans* (geometric) isomers.

Because -CH₃ and -H can rotation in the C=C double bond.

(d) Alkanes and alkenes can be identified by their reactions with a solution of bromine water, $Br_2(aq)$.

Contrast the types of reactions an alkane and an alkene will undergo with an orange solution of bromine water.

ASSESSOR'S USE ONLY

The reaction of Br_2 and alkanes is substitution reaction. A Br atom will conect with a C atom and this C atom will lose a H atom. The reaction of Br_2 and alkenes is addition reaction. Two Br atom will conect with two different C atom, and these two C atom will lose one H atoms in each of them.

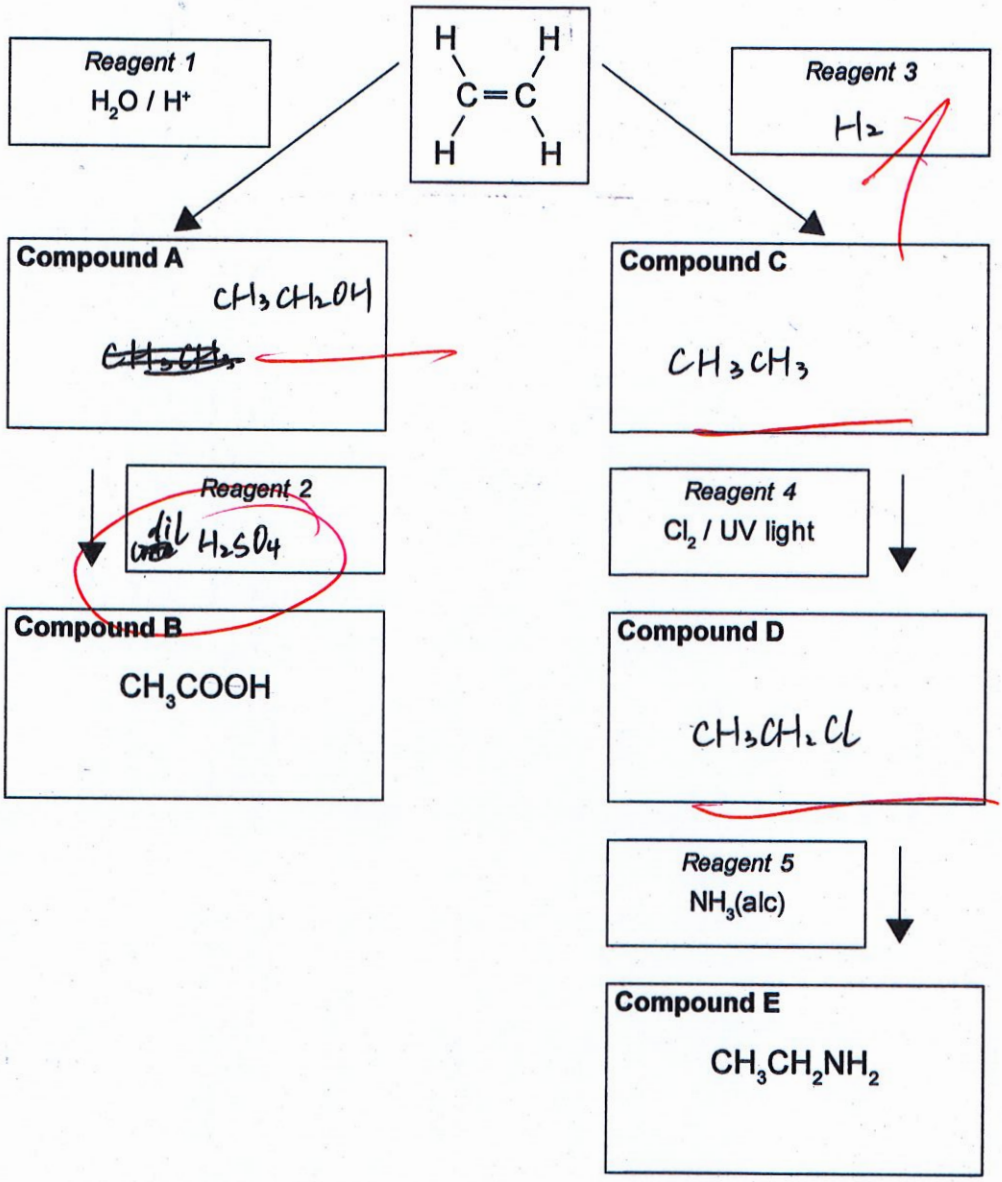
U

A4

QUESTION THREE

ASSESSOR'S USE ONLY

(a) (i) Complete the following reaction scheme by drawing the structural formulae for the organic compounds **A**, **C**, and **D**, and identifying *reagents 2 and 3*.



(ii) Identify the types of reactions that occur to produce compounds **A, B, C, D,** and **E**:

A. ~~Addition~~ Oxidation

B. ~~Substit~~ Substitution

C. Addition

D. Substitution

E. Substitution

4

4

ASSESSOR'S USE ONLY

(b) Describe a simple test that will distinguish between solutions of the final organic compounds **B** and **E**.

Use litmus paper. Add blue litmus paper in solution B, then the blue litmus paper will turn red. Add blue litmus paper in E solution, then the blue litmus paper will stay in blue.

4

(c) Compounds **B** and **E** react together.

(i) Write a balanced equation for the reaction that occurs between compounds **B** and **E**.

$CH_3COOH + CH_3CH_2NH_2 \longrightarrow$

(ii) Identify the type of reaction that occurs between compounds **B** and **E**.

Justify your answer.

It's acid - base reaction.

4

(d) Explain how compound **A** from the reaction scheme could be directly converted into compound **D**.

ASSESSOR'S USE ONLY

$CH_3CH_2OH \xrightarrow{MnO_4^-/H^+} CH_3CH_3$. Add MnO_4^-/H^+ in CH_3CH_2OH solution, the ~~solution~~ colour of solution from ~~purple~~ purple to colourless. It's a oxidation reaction.

A4

Achieved exemplar for 91165 2017	Total score 11

Q	Grade score	Annotation
1	A3	The candidate was awarded A3 for the following reasons: in part (a), the structure of the monomer is incorrect, but a correct equation is given in part (a)(iii); in part (b), correct structure of propene, incorrect explanation of test and in part iii) the major and minor isomers were drawn correctly but were incorrectly identified.
2	A4	The candidate was awarded A4 for the following reasons: in part (a), both functional groups were identified but not named and the correct classification was explained; in part (b), two of the three compounds were named correctly; in part (c), three of the four isomers were drawn correctly and the geometric isomers were correctly drawn and identified; in part (d), the two reaction types were correctly identified but there was an incorrect statement regarding the alkene losing H atoms and the discussion lacked observations, contrast and speed of reactions.
3	A4	The candidate was awarded A3 for the following reasons: in part (a), the candidate correctly identified three formulae and three reaction types; in part (b), the candidate described a correct simple test to distinguish between two different organic compounds; in part (c), an incomplete equation was given, but gave a correct reaction type; in part (d), an incorrect reaction was given.
