VERSUS

NEW DESIGN!
- less parts
- no base
- no button-top
acts as button
- simpler shape

MINIMALISM

TEK SHELL

ORIGINAL ASSEMBLY
w/ original dimensions

SHELL BASE ③

This flat base is a durable substrate that essentially holds the entire shell together. It creates a substrate that all the inner components can be connected to stably.

NOTE:
①②③ are all actually the same colour. Different colours have been used to only differentiate parts.

The rectangular hole is for the battery door to go in, so that holes of the speaker can quickly and easily be replaced via the bottom of the outer shell base.

locking mechanism simply clicks into place the rear shell slides into the front shell

OUTER SHELL SUB-ASSEMBLY
original → new

WHY TWO PARTS?
Splitting the outer shell into two parts makes the circuit easier to access. It also makes the shell stronger as the two pieces support and brace each other.

FRONT SHELL ②

REAR SHELL ①

NEW DIMENSIONS

The shell base ③ is attached to the outer shell assembly ①② via a series of small thin machine screws ④.

The machine screws ④ screw into place via the holes in the shell base ③. There are a total of 10 holes - 5 on each side of the base, 5 for ① and 5 for ②.

These screws hold the outer shell halves together.

SHORT MACHINE SCREWS ④

The bottom of both ③ and ② have holes that correspond with the holes in ①. These holes allow the base ③ to be attached securely to the rest of the outer shell.

the pins and holes correspond accordingly on both of the inner rims of the outer shells. There are a total of 9 PINS on the rear shell ①, and 9 HOLES on the front shell ②.

FRONT SHELL ②

NEW SUB-ASSEMBLY

These were the original dimensions for the rear shell ①. However, if the entire outer shell assembly is not split exactly in half, these dimensions would not make sense. Therefore the dimensions should be changed to correlate with the new design.

NOTION

NEW FINISHED SECTION SUB-ASSEMBLY

SECTION DETAIL VIEW (7+8)

OTHER COMPONENTS

ORIGINAL DIMENSIONS

CHANGES MADE:

- ~~dash~~ added so ③ can be pushed down
- ~~20mm~~ for future LED lights
- made ~~edge~~ so it protrudes inside the shell

The mesh button cover is pushed down into the ditch of ①. It ordinarily sits on the surface of the rubber, but when pushed down it presses the rubber downwards, so both ⑤ and ⑥ can move downwards and trigger the button component ⑧.

BUTTON COMPONENT (8)

NEW OUTER BUTTON SUB-ASSEMBLY

OUTER BUTTON SHELL NEW DIMENSIONS

HOW DO THEY FIT TOGETHER?

This was one of the many changes I had to make. How would these two circular parts fit together? In the end I settled for a simple pin locking mechanism very similar to ① and ②.

BUTTON BRACKET

BUT - how does it connect to ①? I had to create part ② for this to become possible! It acts as a brace and a support.

MESH BUTTON COVER

In order for ⑥ to fit with ⑤, channels need to be made... Pins + Holes need to be added!

TRUE SHAPE (uncurved)

OUTER BUTTON SHELL

This part not only completes the outer shell, but also can be pushed down in order to turn the entire speaker on.

Therefore, in order to fit the button inside the outer button shell ⑤, ⑤ must be hollow.

curved to match the curvature of the outer shell

CIRCUIT

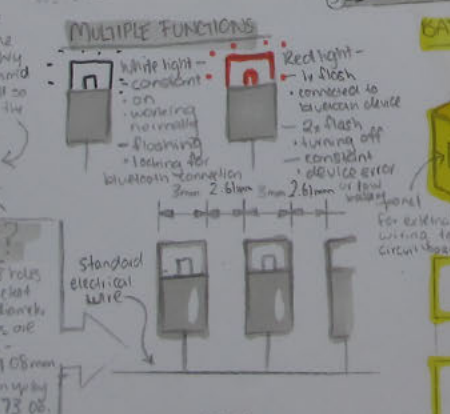

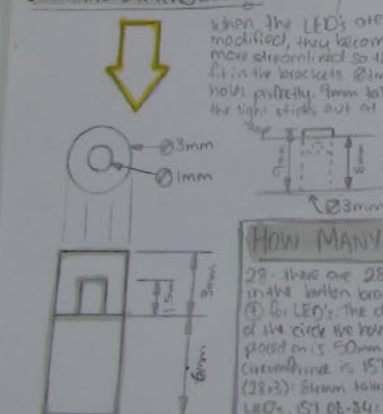

CIRCUIT BOARD (11)
The circuit board uses the power source, LEDs, battery, speaker, and bluetooth together to actually make the product itself work.

LEDs (1)
When the button is pressed down and the speaker is turned on, these multi-colored LEDs also turn on, they shine like small holes around the outside of the button bracket (3).

ORIGINAL DIMENSIONS

NEW DIMENSIONS

HOW MANY?
28 - there are 28 holes in the button bracket (3) for LEDs. The diameter of the circle the holes are placed on is 50mm - circumference is 157.08mm (28 x 3) 5mm taken up by LEDs, 157.08 - 34 = 123.08, 123.08 / 28 = 4.4 = amount of space between each LED hole.

my original idea was to fill the speaker and attach it straight to the base using a metal support - but I didn't know it was possible to weld solder into the speaker (10), therefore I had to come up with a new design utilising the components the speaker (10) already had.

Instead of introducing a new component, why not utilize what we already have? By screwing the speaker (10) to the battery case (12), this gives the speaker adequate support and height, so the sound can be heard clearly. A small block has been added to support the end of the speaker.

Battery case (12) is connected to shell base (3) by two plastic support beams. These are screwed into place using short machine screws (4).

Small block attached to (12) to help support the weight of (10).

Batteries (14) are placed inside the case (12) via the hole in (3) and the battery door (13). The door slides into the base (12) via a small pin and hole mechanism. Can be lifted out via the semi-circular hole in the door itself.

Speaker needs 2 AA standard batteries to function properly. These batteries are inserted in the bottom of the speaker after removing the battery door. Low battery will be signalled via consistent red light from LED's.

AS 91627 (3.30): Initiate design ideas through exploration (4 credits)

Achievement	Achievement with Merit	Achievement with Excellence
Initiate design ideas through exploration.	Initiate design ideas through insightful exploration.	Initiate design ideas through extensive exploration.
<ul style="list-style-type: none"> Use starting experiences and visual communication strategies to <u>explore alternatives and variations to expand design thinking.</u> Ideas are <u>re-generated</u> from alternatives and variations which <u>lead towards</u> design ideas. 	<ul style="list-style-type: none"> Use visual communication strategies to show <u>considered</u> alternatives and variations for the purpose of <u>analysing and re-interpreting</u> ideas. Ideas identify an <u>emerging train of thought that informs</u> design ideas. 	<ul style="list-style-type: none"> Use visual communication strategies to show divergent and perceptive alternatives and variations. Train of thought ideas extend and transform design ideas.

Overall level of attainment for 91627
M

Pages 1- 3 outline a starting point from imagery of a sea turtle and its shell. They show simple but focused exploration and thinking to form shapes and variations that regenerate towards product design ideas of a potential speaker by page 3.

Pages 4 - 7 show re-generation and reorganisation of design elements. By using visual communication strategies of inverse and scale, new reformed variations of speaker design ideas are explored. The introduction of a secondary inspiration point of minimalism on page 7, brings in new focused informed knowledge.

Pages 8 - 12 further explore and reveal considered analysis, and informed ideas that emerge over the sequence with detail, clear train of thought, and re-interpretation of the design.

This submission is a Merit as the speaker does not transform or extend in any divergent way beyond the re-interpreted design ideas. A range of visual communication strategies combined with sketching and rendering to convey the thinking around the product design ideas is used in an effective manner.
