Prevent hazards associated with excavation and traffic control on construction sites

People credited with this unit standard are able to: identify different types of excavation for building and construction sites and apply the appropriate controls for compliance with the Site Safety Plan, Health and Safety in Employment Act 1992 (HSE) and relevant legislation; identify and apply procedures to monitor controls of excavation hazards; and identify the type of Traffic Control needed at building and construction sites and apply procedures to maintain controls of hazards for compliance with the site safety plan, Health and Safety in Employment Act 1992 (HSE) and relevant legislation.

This unit standard is for people who wish to act as Safety Supervisors or become involved in health and safety and injury prevention over a wide range of building and construction activities and environments.

Compliance is required with the hierarchy of controls outlined in the Health and Safety in Employment Act 1992 (HSE), i.e: elimination of significant hazards, isolation of significant hazards when elimination is not practicable, and minimisation of significant hazards where elimination and isolation are not practicable.

All practical steps means all steps to achieve the result that it is reasonably practicable to take in the circumstances, having due regard to: nature and severity of the harm; current state of knowledge about that harm; current state of knowledge about the means available to achieve the result; and availability and cost of each of those means.

Hazards refer to those occurrences, processes, substances or situations as determined by the supervisor that are an actual or potential cause or source of harm associated with, but not limited to: process, activities, environment, equipment, materials, work organisation, site and facilities. Contributing factors may include noise, vibration, temperature, pressure and mechanical, ergonomic stressors, chemical agents.
4 Codes of Practice refer to any issued code of practice approved by the Minister of Labour under Section 20 of the Health and Safety in Employment Act 1992 (HSE), and any work carried out in accordance with that code.

5 Standards refer to any New Zealand or other Standards that provide technical guidance and specifications. Standards may also be specified in Regulations.

6 Guidelines refer to any information on health and safety produced by the Occupation Safety and Health Service of the Department of Labour or Accident Compensation Corporation for the provision of health, safety and injury prevention in the building and construction industry. The guidelines are referenced to Regulations, situations or hazards, and may be based on relevant sections of the Health and Safety in Employment Act 1992, Health and Safety in Employment Regulations 1995, Standards contained in former legislation, or accepted good practice and supportive information.

Specific publication – Guidelines for the Provision of Facilities and General Safety in the Construction Industry issued April 1996 by the Occupational Safety and Health Service of the Department of Labour.

8 Safety Supervisor is defined as a person recognised as a health and safety practitioner pertaining to the building and construction industry or trades.

9 Organisation may refer to any business engaging, controlling, or employing people in a building and construction environment.

10 Site Safety Plan is defined as a building and construction site specific document that demonstrates an organisation’s means of compliance with the Health and Safety in Employment Act 1992, and includes but is not limited to the following:
   • assignment of responsibilities for on site implementation;
   • hazard identification methods;
   • accident investigation and report methods;
   • site emergency procedures;
   • site communication strategy;
   • strategy for the coordination of on site trade activities;
   • site audit procedures.

12 This unit standard requires assessment in a practical work situation, on site. On site refers to a wide range of building and construction environments within which trade skills are required.
Outcomes and performance criteria

Outcome 1

Identify different types of excavation for building and construction sites and apply the appropriate controls for compliance with the Site Safety Plan, Health and Safety in Employment Act 1992 (HSE) and relevant legislation.

Range types of excavation include but are not limited to – trenches, open excavations, demolitions, shafts, and tunnels or drives less than 15 metres in length.

Performance criteria

1.1 Hazards are identified in terms of each type of excavation work to identify the controls required for health and safety compliance.

Range hazard factors include but are not limited to – stability of the soil, proximity of underground services, presence of water, harmful gases, ventilation, noise, access and egress restrictions, roading, traffic management and control, explosives if used, safety of persons, overhead cables, bearing capacity of ground, cutting and shoring of face, support systems, discharge or disposal of waste.

1.2 Controls required when carrying out excavations are applied to ensure that all practical steps are taken to maintain health and safety compliance.

Range areas to be considered but not limited to – prior planning, access for employees, separation of traffic, working space, adequate lighting, handling of equipment and supplies.

Outcome 2

Identify and apply procedures to monitor controls of excavation hazards.

Performance criteria

2.1 Identified hazards and related control measures are documented in accordance with the Site Safety Plan.

2.2 Excavation work is inspected for compliance against Site Safety Plan, relevant legislation and the Health and Safety in Employment Act 1992 (HSE).

Range inspections daily, weekly, monthly, according to changes in the environment and the nature of the work in progress.

2.3 Corrective action is taken to meet provisions of controls required for compliance with health and safety legislation and the site safety plan.

2.4 Results of all inspections are recorded in accordance with the requirements of the site safety plan.
Outcome 3

Identify the type of Traffic Control needed at building and construction sites and apply procedures to maintain controls of hazards for compliance with the site safety plan, Health and Safety in Employment Act 1992 (HSE) and relevant legislation.

Performance criteria

3.1 Hazards are identified in terms of Traffic Controls associated with different types of excavations and constructions, and controls required are identified for health and safety compliance.

Range hazard factors include but are not limited to – loading, unloading and operating trucks and mobile plant, power lines, underground services, laid and laying of pipes, ancillary equipment, parking of machinery, pedestrian traffic, footpaths, access and egress control, conspicuous protective clothing and equipment, signposting (conflicting, unnecessary, damaged), lighting, personnel, plant and site safety, night safety, inadequately trained traffic controllers.

3.2 Controls required when carrying out Traffic Control procedures are applied to ensure that all practical steps are taken to maintain health and safety compliance.

Range areas to be considered but not limited to – prior planning, setting out of worksite for safety and traffic control, regulatory signs and safety equipment, traffic controllers, personnel, plant and site safety, tidy work area, storage of materials and supplies.

3.3 Traffic Control procedures are inspected for compliance against Site Safety Plan, relevant legislation and the Health and Safety in Employment Act 1992 (HSE).

Range inspection prior to work commencement, continuous according to changes in the environment and the nature of the work in progress.

3.4 Corrective action is taken to meet provisions of controls required for compliance with health and safety legislation and the site safety plan.

3.5 Results of all inspections are recorded in accordance with the requirements of the site safety plan.

This unit standard is expiring. Assessment against the standard must take place by the last date for assessment set out below.
